GIFT OF
R.G. Hallidie

Charles Smith Esq

with the Authors imp:

Regent Street

BEING
TABLES.

LIVE STOCK.

THE RIGHT HONOURABLE

1. *Journal of the American Medical Association*, 1997; 277: 1001-1005.

Printed for the Author.

ST. JAMES'S STREET, [REDACTED]
[REDACTED] N.

1819.

HESTIK
C2 C4

207 AG. Hallidie

Entered at Stationers Hall.

Printed by T. C. HANSARD, Peterborough-court, Fleet-street, London.

DEDICATION.

TO THE RIGHT HONOURABLE

JOHN LORD SOMERVILLE.

MY LORD;

AS no one can be more capable of judging of the utility of a work treating on Live Stock than your Lordship, whose personal Experience, public Example, and noble Munificence, have most essentially tended to promote improvement in the breeds and profitable management of Domestic Animals, I feel truly proud that my Tables should go forth to the world sanctioned by your Lordship's name and approbation.

Deeply impressed with a sense of gratitude for your Lordship's condescension in the present

instance, as well as for the numerous favours which your Lordship has on various occasions been pleased to confer upon me, I presume to subscribe myself,

My Lord,

Your Lordship's

Most devoted

And most faithful humble Servant,

LAYTON COOKE.

21 Regent Street

~~21, Regent Street, St. James's~~

P R E F A C E.

THE rapid sale of the former Edition of my Book of Tables ; the numerous testimonials in favour of the principles upon which they are calculated, and in proof of the accuracy with which the nett weight of domestic animals is determined, afford perhaps the best evidence of their practical utility.—A separate and more portable edition of the Tables immediately applying to Live Stock, having been frequently called for, I venture to submit the present pocket volume to the attention of the public.

In the former Edition the Live Weights were directed to be taken in hundred weights, quarters, and pounds, and the Dead Weights of carcase were given in stones of eight pounds, and tenths of stones ; that method has, however, been found inconvenient ; first, because stones of eight pounds are only used in and near London ; and secondly, because the decimal fractions were not at all times understood by those for whose use the work was principally designed. In the present volume a different mode of notation has been adopted,

the whole being stated in pounds, showing more clearly the proportion that the nett bears to the gross weight ; and for the convenience of those who are in the habit of estimating by local weights, a Table is subjoined for assimilating to each other the Provincial Weights used in estimating Live Stock.

No opportunity has been omitted of acquiring the necessary information to enable me to compose these Tables. The Live and Dead Weights of animals exhibited at the Christmas and Spring meetings in London, have, in part, furnished me with data to calculate the proportions that the carcases of animals in a perfectly ripe state bear to the gross Live Weight. I have also been indulged with access to the government victualling establishments, for the purpose of prosecuting my inquiries ; and it is with pleasure that I acknowledge the obligations I am under to many individuals who have favoured me with the results of their own experiments, and have afforded me opportunities of acquiring information on the subject, which, notwithstanding the extent of my own practice as an agriculturist, I could not, without their assistance, have obtained.

From these and other sources of information I have been induced, in the present Edition, to

make some alteration in the Dead Weights of the middling and inferior classes of animals.

I cannot forego the satisfaction of observing, that since the former Edition of my Tables was published, the plan of weighing animals alive, with a view to ascertain the nett weight of the carcase, has been very extensively adopted, and the improvements which have recently been made in machines applicable to that purpose, will, in all probability, cause the adoption of this system to be universal.

name some distinction in the Social Rights of the
existing and inferior classes of society.

I cannot deny the real value of observing
that since the former Edition of the Essay was
published, the plan of the present Edition has
been to ascertain the state of the various
classes of society, and to show the
progress of the different classes of the
community, and to show the
state of the different classes of the
community, and to show the
state of the different classes of the
community.

INTRODUCTION.

EXPLANATION OF THE TABLES.

THE attention which gentlemen of landed property have of late years paid to the improvement of the breeds of Domestic Animals, and the encouragement which the professional breeders and feeders have received from their patronage and support, have materially promoted the public interest. But the benefits which ought to attend superior management will not be fully attained by each individual, if the grazier possess not an equal knowledge with the butcher of the nett weight of the carcase, of the proportion of offal, and consequently of the true value of the stock he may have to dispose of. The object of the present work is, to communicate that information in a certain and easy manner to the former, which is obtained by the latter by habit and experience, though certainly with less accuracy.

Nothing but continual practice will enable any one to *guess* the weight of animals with any degree of precision; and if the attention of a person deemed expert have been for a length of time diverted from that practice to other objects, he will

not, on resuming it, immediately feel that confidence in his own opinion, which he possessed when in the regular exercise of his talent. It must necessarily follow, that those who have only occasionally a few fat animals to dispose of, with no other opportunity of acquiring information than what their own concerns afford them, will meet a purchaser upon very unequal terms, it being the principal study of the latter, who, besides the opportunity of handling them while alive, has the additional advantage of weighing them when dead, and, in general, of reserving to himself the best evidence for regulating his future judgment. In disposing of most productions of the soil, the weight or measure is usually known, and the only question to be determined is, the market price; which will of course vary according to the quality, the quantity in the market, and the supply required. But in dealing for fat cattle, the weight is separately computed by each party, and the value calculated according to their respective computations of the weight and estimation of the quality; which frequently occasions material difference in the estimated value, particularly when either of the parties happen to be inexperienced.

➤ An attempt to remedy these inconveniences was made by calculating a set of Tables, with a view to ascertain the dead weight of the four quarters, by measuring the animal while alive: and if it be moderately fat, of perfect symmetry, and carry its

weight regularly throughout, they may afford a tolerably accurate idea of the truth: but when an animal varies in any degree in these essential qualities, they must inevitably err, being calculated upon the presumption of the animal's being perfectly cylindrical, and of each cubic foot weighing 42 lb.: "the girth is taken just behind the shoulder-blade, and the length from the fore part of the shoulder-blade, to the bone in the tail that plumbs the line with the hind part of the buttock." The dimensions may be worked by the rule for finding the contents of a cylinder by the circumference; namely, by squaring the girth, multiplying the product by $\cdot 07958$ for the area of unity, or (which will be near enough for the present purpose) by $\cdot 08$, and multiplying the last product by the length for the solid contents. When animals are heavy before (where the girth is taken), and light in the hind quarters, they will measure so as to give a computed weight greater than the real; and if light before, and heavy behind, the computed will turn out inferior to the true weight.

*Example
doubtless*

In order to reduce that to a SYSTEM which has hitherto been conducted with considerable uncertainty—to ascertain, with a degree of precision hitherto unknown, the nett profitable weight of Cattle, Calves, Sheep, and Swine, and thus enable a seller to meet a purchaser upon equitable terms, the following Tables were composed; which show the proportion that the carcasses or quarters of animals dead, bear to their gross Live Weight.

The Tables consist of a column for the Live Weights, and of three columns denoting the Dead Weights of carcase, according to the different state of fatness, viz. one for animals that are only half fat, one for those moderately fat, and the other for those that are extra fat, or such as have arrived at a perfect state of ripeness.

In the Table for Cattle the proportional weight of hide and tallow is given in a fifth column : and it will, in most cases, be found, if the carcase exceed the weight found by the Tables (according to the degree of fatness of the animal as before explained), that there will be a deficiency in the weight of the hide and tallow ; and when the carcase does not weigh so much as stated in the Tables, it may safely be concluded that there is an excess of hide and tallow. This may arise from different causes ; but perhaps nothing contributes to produce this variation more, than the age of the animal ; young animals seldom having so large a proportion of loose fat as those which are older ; or to speak technically, “ they never die so well.”

It will however occur to the reader, that the Tables will, in either case, show the nett profitable weight, allowing the buyer a fair proportion of offal.

Animals having a propensity to early maturity, usually lay the fat on externally, and have a smaller proportion of internal loose fat ; whereas those

which cannot be, or are not fatted till a later period, have a greater inclination to tallow, and the carcase is proportionally lighter.

The presence of internal fat, the quality of the flesh, and the aptitude to fatten, though indicated by external points, can only be ascertained by the *touch*, and do not therefore come immediately within the limits of the present work, which is written principally for those who know when an animal is fat, but are not competent to guess the nett weight of the carcase.

When animals are taken from their regular food, and weighed without being fasted, deduct either from the Live or Dead Weight ; if half fat 7, moderately fat 6, or extra fat 5 per cent. Although in fasting animals taken from different kinds of food, they will not lose precisely similar proportions, the above deductions may be taken as a fair general average ; but for such as have had a long drift, or those which have suffered by a short one, no deduction for fasting need be made ; nor ought a full deduction to be made even for those which have experienced more care in driving.

The proportion that the weight of the carcase or quarters of an ox bears to, the gross Live Weight will vary from 54 to 70 per cent ; that is to say, the carcase of an ox only half fat will be 54 per cent ; if moderately fat 62 per cent ; extra fat 70 per cent ;

and if more than moderately fat, but not quite ripe, the mean between them, namely, 66 per cent. Consequently the offal of a half fat ox will be 46 per cent. ; of a fat ox 38 per cent ; and of an extra fat ox 30 per cent.

The component parts of a ripe Ox (fasted) have been found to correspond to the following proportions :

COLD.

Carcase or quarters, skirts, and kidneys	{ Meat .6 } { Bone .1 }	·7000
Loose fat		·0900
Hide and horns.....		·0550
Head, brains, and tongue		·0230
Feet		·0140
Heart, lights, sweetbread, and bladder		·0084
Tripe (without fat), feck, reed, liver, gall, and melt ..		·0256
Intestines and contents		·0362
Blood		·0278
Loss by evaporation in cooling		·0200
		<hr/>
		1·0000
		<hr/>

If, therefore, the Live Weight of a ripe Ox (fasted) be multiplied by the proportional number opposite to either of the respective parts, the product will be the weight of that component part.

The carcase, or quarters of a CALF bears a proportion of from 54 to 66 per cent of the whole.

The component parts of a Calf moderately fat have been found to correspond to the following proportions:

COLD.

Quarters	·6000
Head	·0583
Pluck	·0542
Feet.....	·0333
Skin.....	·1000
Loose fat, entrails, and contents	·1000
Blood	·0333
Sweetbread and leanbread.....	·0042
Loss by evaporation	·0167
	<hr/>
	1·0000
	<hr/>

The proportion that the carcase of a SHEEP bears to the whole, varies from 54 to 68 per cent.

The component parts of a ripe Sheep (fasted, and the weight of the wool and extraneous matter adhering thereto, deducted) have been found to correspond to the following proportions:

COLD.

Quarters	·680
Head	·030
Loose fat	·070
Pelt (without wool)	·055
Pluck.....	·025
Intestines and contents	·085
Blood, and loss by evaporation in cooling	·055
	<hr/>
	1·000
	<hr/>

The proportion that the SIDES, HEAD, FEET, and FLAE of SWINE, bear to the gross weight (fasted) varies from 75 to 85 per cent.

The component parts of a ripe Hog (fasted) have been found to correspond to the following proportions:

COLD.

Sides	·7200	} ·8500
Flae.....	·0747	
Head	·0500	
Feet.....	·0053	
Feck, crow, and caul.....	·0553	
Pluck	·0125	
Blood	·0180	
Intestines and contents.....	·0214	
Hoofs, hair, and loss by evaporation in cooling	·0428	
	<hr/>	
	10·000	
	<hr/>	

Until lately one of the conditions upon which persons became entitled to receive the premiums given by the Smithfield Club was, that they should deliver to the secretary, for the use of the Club, a detailed statement, signed by the butcher, of the Live and Dead Weights of the animals for which the premiums were awarded; the information obtained by this means was particularly interesting, and tended in no small degree to promote the great object for which the Smithfield Club was originally instituted.

A few extracts from the above-mentioned returns are annexed, to which the Dead Weights, according to these Tables, are subjoined; and a comparison of the products found by the Tables, with the return of the actual weights will best prove the accuracy of the principles upon which they have been calculated.

S H E E P.		Live Weight.		Actual Dead Weight.		Dead Weight by Cooke's Tables.

	Ditto					

The utility of weighing animals alive in order to ascertain the nett weight of the carcase, it is presumed, is clearly demonstrated by the specimens above given. And it is respectfully submitted that if cattle, &c. were weighed previous to their being sent to Smithfield or other markets, it might correct the judgment of the grazier, and, by enabling him to estimate their value with greater accuracy, prevent the disappointments not unfrequently experienced on the receipt of the salesman's accounts. Indeed, were the plan of weighing animals alive to be universally adopted, it would greatly facilitate the business of buying and selling live stock, and reduce this description of traffic to rational principles. And although it is not improbable that some, under the influence either of interest or prejudice, may be disposed to object to the general introduction of a system that would greatly extend correct information on this interesting subject, there is no doubt that the amateur, the young grazier, and all who prefer matter of fact to conjecture, will avail themselves of the advantages it offers.

To render the Tables for estimating the nett weight of domestic animals generally useful, a Table is subjoined for assimilating to each other various provincial weights, showing at one view the number of stones of 8 lb., stones of 14 lb., scores of 20 lb., or hundred weights, quarters, &c. corresponding to any number of pounds, from 8 to 3640.

The Live and Dead proportionate Weights of cattle, &c. being given, the Tables may be applied to any description of weight ; for instance, they may either be pounds English, pounds of the different weights used in Scotland, or they may be considered as the French livre, German pfunt, Russian foont, &c.; or stones of any number of pounds; as it will be observed, that the proportionate Dead Weight will always be shown according to that denomination ^{of weight} in which the Live Weight shall have been taken. It is also observable, that although the Scotch pounds vary as to the number of ounces, ^{their stones} ~~they~~ invariably consist of 16 pounds; the number of Scotch stones corresponding to any number of Scotch pounds may therefore be found by Table V, by taking half the number of stones of 8 pounds.

(2)

The following is a list of the names of the persons who have been
admitted to the office of the Secretary of the State of New York
since the 1st of January 1880, and who have been sworn in
as such officers of the State. The names are given in alphabetical
order, and the date of admission is given in parentheses.

TABLES.

TABLE I.

Showing the nett profitable Weight of

NEAT CATTLE.

FIND the live weight in the first column, and on a line with it, in the second, third or fourth column (according to the condition of the animal) is the weight of the Carcase or Quarters:—the fifth column shows the estimated weight of Hide and Tallow.

Example—If an Ox alive (fasted) weigh 700 pounds, the weight of Carcase, half fat will be 378 pounds, moderately fat 434 pounds, extra fat 490 pounds, Hide and Tallow 101 pounds; and if more than moderately fat, but not extra fat, the mean between them, namely 462 pounds.

When weighed alive without being fasted, deduct either from the live or dead weight of those

Half fat	7	} per Cent.
Moderately fat...	6	
Extra fat	5	

To ascertain the number of stones, scores, hundred weights, &c. corresponding to the pounds, see Table 5 for assimilating to each other the provincial weights used in estimating live stock.

TABLE II.

Showing the nett profitable Weight of
CALVES.

CALVES should be weighed at noon previous to their being suckled.

Find the live weight in the first column, and on a line with it, in the second, third or fourth column (according to the state of fatness) is the weight of the Carcase or Quarters.

Example—If a Calf alive weigh 220 pounds, the weight of Carcase, half fat will be 118 pounds, moderately fat 132 pounds, extra fat 145 pounds.

To ascertain the number of stones, scores, hundred weights, &c. corresponding to the pounds, see Table 5 for assimilating to each other the provincial weights used in estimating live stock.

S H E E P.

TABLE III.

Showing the nett profitable Weight of **SHEEP.**

FROM the gross Live Weight deduct the estimated weight of the Fleece and any extraneous matter adhering thereto, and seek in the Table for the remainder only.

Example.—A Sheep (fasted) weighs 130 pounds, and the Fleece is estimated at 4 pounds—deduct 4 from 130, and refer to the first Column of the Table for the remainder, namely, 126 pounds; and if half fat the Carcase will be 68 pounds, moderately fat 76 pounds, extra fat 85 pounds; if more than moderately fat, but not extra fat, the mean between them, namely 80 pounds.

When weighed without being fasted, deduct either from the live or dead weight if

Half fat	7	} per Cent.
Moderately fat...	6	
Extra fat	5	

To ascertain the stones, scores, hundred weights, &c. corresponding to the pounds, see Table 5 for assimilating to each other the provincial weights used in estimating live stock.

SWINE.

TABLE IV.

Showing the nett profitable Weight of
SWINE.

FIND the live weight in the first column, and on a line with it, in the second, third or fourth column (according to the state of fatness) is the weight of Carcase including the *Sides, Head, Feet, and Flae.*

Example.—If a Hog alive (fasted) weigh 120 pounds, the weight of Carcase, including Sides, Head, Feet, and Flae, half fat will be 90 pounds, moderately fat 96 pounds, extra fat 102 pounds.

When weighed without being fasted, deduct either from the live or dead weight, if

Half fat	7	} per Cent.
Moderately fat...	6	
Extra fat.....	5	

To ascertain the stones, scores, hundred weights, &c. corresponding to the pounds, see Table 5 for assimilating to each other the provincial weights used in estimating live stock.

PROVINCIAL WEIGHTS

USED IN ESTIMATING LIVE STOCK.

TABLE V.

FOR assimilating to each other the Provincial Weights used in estimating Live Stock ; in which the quantities under the different denominations of weight are on each line of equal value.

Example.

80 pounds is equal to

10 London stones of 8 pounds—or

5 stones and 10 pounds, at 14 pounds to the stone—or

4 scores of 20 pounds—or

0 cwt. 2 qrs. 24 lb.

For the application of the Tables to the Irish, Scotch, and Foreign Weights, see Introduction.
